Project 6 · Move a Windows Server from AWS to Azure

Where each piece lives, what Terraform builds, and what the Azure portal builds. Drawn from the files in 06-aws-to-azure-migrate-poc on Oct 25.

Review changes not in the files yet

1. Source firewall: also allow 445, 135 and 5985 from the replication appliance, and open File and Printer Sharing and WMI on the guest, so the agent can be pushed.
2. Both Azure groups: tags lifetime=1d, owner, project, created.
3. Teardown with az group delete, because the portal builds things Terraform does not track.

Built with Terraform · Made in the portal or at cutover · Planned, not written yet
